## Description

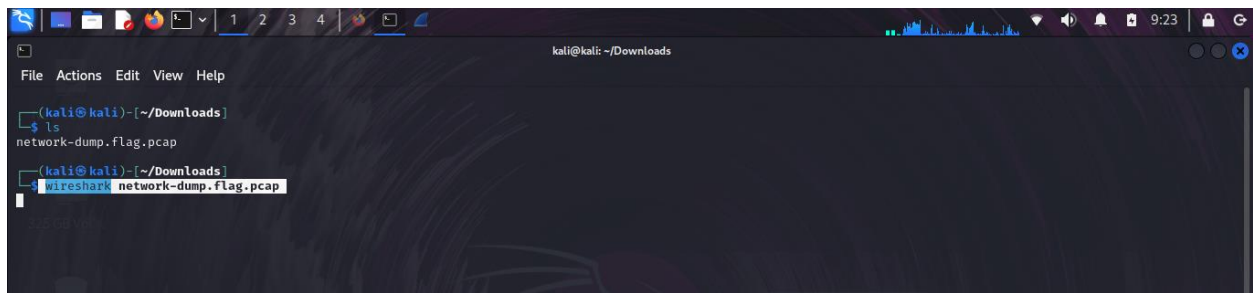

Download the packet capture file and use packet analysis software to find the flag.

- Download packet capture

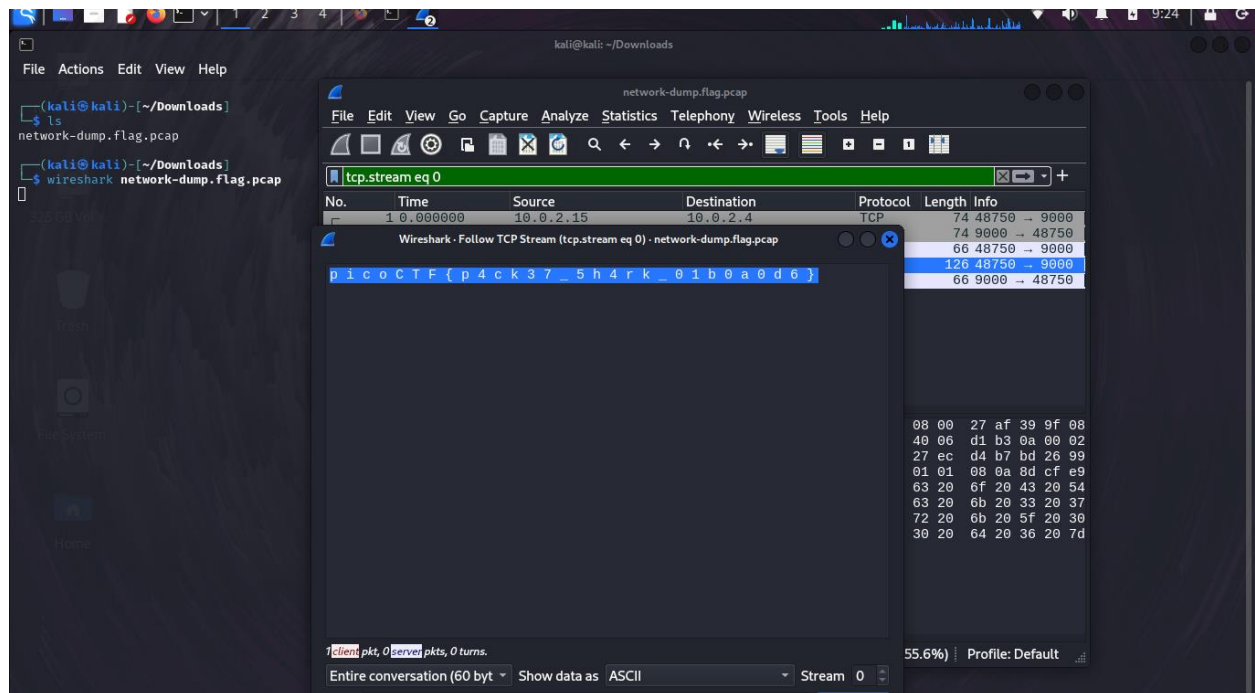

**Hint:** Wireshark, if you can install and use it, is probably the most beginner friendly packet analysis software product

## Solution

I began by downloading the provided capture file for further analysis. I then opened the capture file in Wireshark, a powerful network protocol analyzer, to examine its contents.

In Wireshark, I navigated to the "Analyze" tab and selected the "Follow TCP Stream" option. This allowed me to view the complete content of the communication in a more readable format.

Within the stream, I found the flag in plain text, which was clearly marked and accessible for submission.
